# Package 'lrgpr'

July 2, 2014

Title lrgpr

Version 0.1.1
<b>Date</b> June 26, 2014
Author Gabriel E. Hoffman
Maintainer Gabriel E. Hoffman <gabriel.hoffman@mssm.edu></gabriel.hoffman@mssm.edu>
<b>Description</b> Fit a Low Rank Gaussian Process Regression (LRGPR) / Linear Mixed Model (LMM) for large datasets. These models are widely used in statistical genetics as a test of association while correcting for the confounding effects of kinship and population structure.
$\label{eq:percentage} \textbf{Depends} \ \ R \ (>= 3.0.0), \ methods, \ Rcpp, \ RcppGSL, \ RcppProgress, \ MASS, formula. tools, \ BH, \ doParallel, \ bigmemory \ (>= 4.4.7), bigmemory.sri, \ aod$

AIC.lrgpr

Akaike's Information Criterion (AIC)

## Description

AIC for model fit by lrgpr

## Usage

```
AIC.lrgpr(object, ..., k = 2)
```

## Arguments

object model fit with lrgpr
... other arguments

k for compotability, not used

BIC.lrgpr 3

BIC.lrgpr

Bayesian Information Criterion (BIC)

### Description

```
BIC for model fit by lrgpr
```

### Usage

```
## S3 method for class lrgpr
BIC(object, ...)
```

### Arguments

```
object model fit with lrgpr
... other arguments
```

 ${\tt coefficients.lrgpr}$ 

Extract Model Coefficients

### Description

Coefficients estimated with lrgpr

### Usage

```
## S3 method for class lrgpr
coefficients(object)
```

### Arguments

```
object model fit with lrgpr
... other arguments
```

4 cooks.distance.lrgpr

convertToBinary

Convert ASCII to binary file

#### **Description**

Converts TPED/DOSAGE/GEN files to binary format

#### Usage

### **Arguments**

filename file to be converted

filenameOut name of binary file produced

format specify 'TPED', 'DOSAGE' or 'GEN'

nthreads number of threads to use

#### **Details**

- TPED: plink file can be in either -recode or -recode12 format
- DOSAGE: file follows plink format: http://pngu.mgh.harvard.edu/~purcell/plink/dosage.shtml

### Example:

```
SNP A1 A2 F1 I1 F2 I2 F3 I3
rs0001 A C 0.98 0.02 1.00 0.00 0.00 0.01
rs0002 G A 0.00 1.00 0.00 0.00 0.99 0.01
where the F* values correspond to the dosage values
```

• GEN: file follows OXFORD format

#### **Description**

cooks.distance.lrgpr

Basic quantities for regression deletion diagnostics from fit of 1rgpr

### Usage

```
## S3 method for class lrgpr
cooks.distance(model, infl = lm.influence(model, do.coef =
   FALSE), res = weighted.residuals(model),
   sd = sqrt(deviance(model)/df.residual(model)), hat = infl$hat, ...)
```

Regression Deletion Diagnostics

criterion.lrgpr 5

### **Arguments**

model	model fit with lrgpr
infl	influence structure as returned by lm.influence
res	residuals
sd	standard deviation to use
hat	hat values
	other arguments

criterion.lrgpr

Compute AIC/BIC/GCV for 1rgpr model as rank changes

### **Description**

Evaluate information criteria to select an optimal rank for model fit by 1rgpr

### Usage

```
criterion.lrgpr(formula, features, order, rank = c(seq(1, 10), seq(20, 100, by = 10), seq(200, 1000, by = 100)))
```

### Arguments

formula standard linear modeling syntax as used in 'lm'

features matrix from which the SVD is performed

order sorted indices of features. When rank is 10, decomp = svd(X[,order[1:10]])

rank array with elements indicating the number of confounding covariates to be used in the random effect.

#### See Also

plot.criterion.lrgpr, cv.lrgpr

### **Examples**

```
n = 300
p = 5000
X = matrix(sample(0:2, n*p, replace=TRUE), nrow=n)

dcmp = svd(X)

# simulate response
h_sq = .8
eta = dcmp$u[,1:2] %*% rgamma(2, 2, 1)
error_var = (1-h_sq) / h_sq * var(eta)
y = eta + rnorm(n, sd=sqrt(error_var))
```

6 cv.lrgpr

```
# Get ordering based on marginal correlation
i = order(cor(y, X)^2, decreasing=TRUE)

# Fit AIC / BIC / GCV based on degrees of freedom
fit = criterion.lrgpr( y ~ 1, features=X, order=i)
plot(fit)
```

cv.lrgpr

Cross-validation for lrgpr

### **Description**

Fit cross-validation for multiple ranks of lrgpr

### Usage

```
cv.lrgpr(formula, features, order, nfolds = 10, rank = c(seq(0, 10), seq(20, 100, by = 10), seq(200, 1000, by = 100)), nthreads = 1)
```

### **Arguments**

formula standard linear modeling syntax as used in 'lm'

features matrix from which the SVD is performed

order sorted indices of features. When rank is 10, decomp = svd(X[,order[1:10]])

nfolds number of training sets

rank array with elements indicating the number of confounding covariates to be used in the random effect.

### Examples

nthreads

```
n = 300
p = 5000
X = matrix(sample(0:2, n*p, replace=TRUE), nrow=n)

dcmp = svd(X)

# simulate response
h_sq = .8
eta = dcmp$u[,1:2] %*% rgamma(2, 2, 1)
error_var = (1-h_sq) / h_sq * var(eta)
y = eta + rnorm(n, sd=sqrt(error_var))

# Get ordering based on marginal correlation
i = order(cor(y, X)^2, decreasing=TRUE)

# Fit cross-validation
```

number of threads to be used

df.residual.lrgpr 7

```
fit = cv.lrgpr( y ~ 1, features=X, order=i)
plot(fit)
```

df.residual.lrgpr

Residual Degrees-of-Freedom

### Description

Residual df from fit of lrgpr

### Usage

```
df.residual.lrgpr(object, ...)
```

### Arguments

object model fit with lrgpr
... other arguments

error.bar

Plot Error Bars

### **Description**

Plot error bars for a confidence interval

### Usage

```
error.bar(x, y, upper, lower = upper, length = 0.1, ...)
```

### Arguments

```
x x-axis positiony y-axis position
```

upper height of bar above y
lower height of bar below y

length horizontal length of the error bar

... arguments for arrows(...)

8 getAlleleVariance

getAlleleFreq

Calculate allele frequency

### Description

Calculate allele frequency

### Usage

```
getAlleleFreq(X, nthreads = detectCores(logical = TRUE), progress = TRUE)
```

### **Arguments**

X matrix where each column is a marker coded 0,1,2 or with dosage values in this

range

nthreads number of threads to use

progress show progress bar

getAlleleVariance

Evaluate variance for each column

### Description

Evaluate variance for each column

### Usage

```
getAlleleVariance(X, nthreads = detectCores(logical = TRUE),
    progress = TRUE)
```

### **Arguments**

X matrix where each column is a marker

nthreads number of threads to use

progress show progress bar

getMACHrsq 9

getMACHrsq

Evaluate MACH r^2 information metric for each column

#### **Description**

Evaluate MACH r^2 information metric for each column

### Usage

```
getMACHrsq(X, nthreads = detectCores(logical = TRUE), progress = TRUE)
```

#### **Arguments**

X matrix where each column is a marker

nthreads number of threads to use progress show progress bar

See definition in Supplementary information S3 for Marchini and Howie (2010): http://www.nature.com/nrg/journal/v11/n7/extref/nrg2796-s3.pdf.

#'

#### References

Marchini, J. and B. Howie. (2010) Genotype imputation for genome-wide association studies. \_Nature Reviews Genetics\_ 11, 499-511 '

getMissingCount

Count missing values

### Description

Count missing values

#### Usage

```
getMissingCount(X, nthreads = detectCores(logical = TRUE), progress = TRUE)
```

#### **Arguments**

X matrix where each column is a marker

nthreads number of threads to use

progress show progress bar

10 glmApply

glmApply	Fit standard (i.e. fixed effects) linear or logistic model for many markers

### **Description**

Analogous to lrgprApply, but fits standard (i.e. fixed effects) linear or logistic models for many markers

### Usage

```
glmApply(formula, features, terms = NULL, family = gaussian(),
  useMean = TRUE, nthreads = detectCores(logical = TRUE), verbose = FALSE,
  progress = TRUE, cincl = c(), cexcl = c())
```

### Arguments

formula	standard linear modeling syntax as used in 'lm'. SNP is a place holder for the each successive column of features
features	a matrix where the statistical model is evaluated with SNP if formula replace by each column successively
terms	indices of the coefficients to be tested. The indices corresponding to SNP are used if terms is not specified
family	gaussian() for a continuous response, and binomial() to fit a logit model for a binary response
useMean	if TRUE, replace missing entries with column mean. Otherwise, do not evaluate the model for that column
nthreads	number of to use for parallel execution
verbose	print additional information
progress	show progress bar
cincl	column indeces of features to include for analysis
cexcl	column indeces of features to exclude for analysis

### **Examples**

```
# Generate data
n = 100
p = 500
X = matrix(sample(0:2, n*p, replace=TRUE), nrow=n)
y = rnorm(n)
sex = as.factor(sample(1:2, n, replace=TRUE))
# Fit model for all markers
pValues = glmApply( y ~ sex + sex:SNP, features=X, terms=c(3,4))
```

glmApply2

```
# Multivariate model
n = 100
p = 1000
m = 10

Y = matrix(rnorm(n*m), nrow=n, ncol=m)
X = matrix(rnorm(n*p), nrow=n, ncol=p)

res = glmApply( Y ~ SNP, features = X, terms=2)

# p-values for univariate hypothesis test of each feature against
# each response
res$pValues
```

glmApply2

(Experimental) faster version of glmApply

### **Description**

Like glmApply, by linear instead of quadratic as a function of the number of covariates. This is still experimental

#### Usage

```
glmApply2(formula, features, terms = NULL, family = gaussian(),
  useMean = TRUE, nthreads = detectCores(logical = TRUE), verbose = FALSE,
  progress = TRUE, cincl = c(), cexcl = c())
```

influence.lrgpr

Regression Diagnostics

### **Description**

Basic quantities for regression diagnostics from fit of lrgpr

### Usage

```
## S3 method for class lrgpr
influence(model, ...)
```

### Arguments

```
model model fit with lrgpr
... other arguments
```

12 logLik.lrgpr

leverage.lrgpr

Regression Diagnostics

### **Description**

Basic quantities for regression diagnostics from fit of lrgpr

### Usage

```
leverage.lrgpr(object)
```

### Arguments

object

model fit with 1rgpr

lm.influence.lrgpr

Regression Diagnostics

### Description

Basic quantities for regression diagnostics from fit of lrgpr

### Usage

```
lm.influence.lrgpr(object, ...)
```

### **Arguments**

object model fit with lrgpr
... other arguments

logLik.lrgpr

Extract Log-Likelihood

### Description

Log-Likelihood for model fit by 1rgpr

### Usage

```
logLik.lrgpr(object, ...)
```

### Arguments

object model fit with lrgpr
... other arguments

loss.lrgpr

### Description

Compare observed and fitted response under some loss function

### Usage

```
loss.lrgpr(y, yhat, family)
```

### **Arguments**

У	observed response
yhat	fitted response

family "gaussian" or "binomial"

1rgpr Fit a Low Rank Gaussian Process Regression (LRGPR)/Linear Mixed Model (LMM)

### Description

Fit LRGPR/LMM models that account for covariance in response values, but where the scale of the covariance is unknown. Standard linear modeling syntax is used for the model specification in addition to a covariance matrix or its eigen-decomposition.

### Usage

```
lrgpr(formula, decomp, rank = max(ncol(decomp$u), ncol(decomp$vectors)),
  delta = NULL, nthreads = 4, W_til = NULL, scale = TRUE,
  diagnostic = FALSE)
```

### **Arguments**

formula	standard linear modeling syntax as used in 'lm'
decomp	eigen-decomposition produced from eigen(K), where K is the covariance matrix. Or singular value decomposition $svd(X[,1:100])$ based on a subset of markers
rank	decomposition is truncated to the first rank eigen-vectors
delta	ratio of variance components governing the fit of the model. This should be estimated from a previous evaluation of 'lm' on the same response and eigendecomposition
nthreads	number of threads to use for parallel execution

14 lrgpr

W\_til markers used to construct decomp that should now be removed from costruction

of decomp. This is the proximal contamination term of Listgarten, et al. (2012)

scale should W\_til be scaled and centered

diagnostic compute diagnostic statistics to be used with plot()

#### Value

coefficients regression coefficients for each covariate

p.values p-values from Wald test of each coefficient

sd standard deviation of each coefficient estimate

sigSq\_e variance component

 $\sigma_e^2$ 

corresponding to the residual error

sigSq\_a variance component

 $\sigma_a^2$ 

corresponding the scale of the covariance, K

delta ratio of variance components:

 $\sigma_e^2/\sigma_a^2$ 

rank the rank of the random effect
logLik log-likelihood of the model fit
fitted.values estimated response values: y\_hat
alpha BLUP of the random effect

Sigma variance-covariate matrix of estimate of beta
hii diagonals of the matrix H such that y\_hat = Hy

y responses x design matrix

df effective degrees of freedom: trace(H) based on Hoffman (2013)

residuals residuals of model fit: y - y\_hat
AIC Akaike information criterion
BIC Bayesian information criterion
GCV generalized cross-validation
eigenVectors eigen-vectors in decomp
eigenValues eigen-values in decomp

df.residual n - ncol(X)

rank rank of decomposition used, where only non-negative eigen/singular values are

considered

lrgpr 15

#### **Details**

lrgpr fits the model:

$$y = X\beta + \alpha + \epsilon$$

$$\alpha \sim N(0, K\sigma_a^2)$$

$$\epsilon \sim N(0, \sigma_e^2)$$

where

$$\delta = \sigma_e^2/\sigma_a^2$$

In practice the eigen-decomposition of K, and not K itself is required. The rank can be set to use only eigen-vectors 1:rank in the model.

This package allows hypothesis tests of single coefficients using fit\$p.values which fits a Wald test. Composite hypothesis tests of multiple coefficients are performed with wald(fit, terms=1:3).

Note that likelihood ratio tests with linear mixed models do not perform well and the resulting p-values often do not follow a uniform distribution under the null (Pinheiro and Bates, 2000). We strongly advise against using it with this model.

1rgpr uses the algorithm of Lippert, et al. (2011).

See Hoffman (2013) for an interpretation of the linear mixed model.

16 lrgprApply

#### **Examples**

```
# Generate random data
set.seed(1)
n <- 200
y <- rnorm(n)
K <- crossprod( matrix(rnorm(n*1000), ncol=n) )</pre>
age <- rpois(n, 50)
sex <- as.factor(sample(1:2, n, replace=TRUE))</pre>
decomp <- eigen(K)</pre>
# Fit the model
fit <- lrgpr( y ~ sex + age, decomp, diagnostic=TRUE)</pre>
# Print results
fit
# Print more detailed results
summary(fit)
# P-values for each covariate
fit$p.values
# Visualize fit of the model like for lm
par(mfrow=c(2,2))
plot(fit)
# Composite hypothesis test using Walds test
# Joint test of coefficients 2:3
wald( fit, terms=2:3)
```

lrgprApply

Fit a Low Rank Gaussian Process Regression (LRGPR)/Linear Mixed Model (LMM) for many markers

### **Description**

Fit LRGPR/LMM models that account for covariance in response values, but where the scale of the covariance is unknown. It returns p-values from a Wald test equivalent to the results of using lrgpr and wald, but is designed to analyze thousands of markers in a single function call.

### Usage

```
lrgprApply(formula, features, decomp, terms = NULL,
  rank = max(ncol(decomp$u), ncol(decomp$vectors)), map = NULL,
  distance = NULL, dcmp_features = NULL, W_til = NULL, scale = TRUE,
  delta = NULL, reEstimateDelta = FALSE, nthreads = detectCores(logical =
  TRUE), verbose = FALSE, progress = TRUE, cincl = c(), cexcl = c())
```

lrgprApply 17

### **Arguments**

formula standard linear modeling syntax as used in 'lm'. SNP is a place holder for the

each successive column of features

features a matrix where the statistical model is evaluated with SNP if formula replace by

each column successively

decomp eigen-decomposition produced from eigen(K), where K is the covariance ma-

trix. Or singular value decomposition svd(features[,1:100]) based on a subset of

markers

terms indices of the coefficients to be tested. The indices corresponding to SNP are

used if terms is not specified

rank decomposition is truncated to the first rank eigen-vectors

map p x 2 matrix where each entry corresponds to a marker in features. First column

is the marker names, second columns is the genetic or physical location

distance size of the proximal contamination window in units specifed by map.

dcmp\_features the indices in features of the markers used to construct dcmp

W\_til markers used to construct decomp that should now be removed from costruction

of decomp. This is the proximal contamination term of Listgarten, et al. (2012)

scale should W\_til be scaled and centered

delta ratio of variance components governing the fit of the model. This should be

estimated from a previous evaluation of 'lm' on the same response and eigen-

decomposition

reEstimateDelta

should delta be re-estimated for every marker. Note: reEstimateDelta=TRUE is

much slower

nthreads number of to use for parallel execution

verbose print extra information progress show progress bar

cincl column indeces of features to include for analysis cexcl column indeces of features to exclude for analysis

#### **Examples**

```
# Generate data
n = 100
p = 500
X = matrix(sample(0:2, n*p, replace=TRUE), nrow=n)
y = rnorm(n)
sex = as.factor(sample(1:2, n, replace=TRUE))
K = tcrossprod(matrix(rnorm(n*n*3), nrow=n))
decomp = eigen(K, symmetric=TRUE)
# Fit null model
fit = lrgpr( y ~ sex, decomp)
```

18 plot.cv.lrgpr

```
# Fit model for all markers pValues = lrgprApply( y \sim sex + sex:SNP, features=X, decomp, terms=c(3,4), delta=fit$delta)
```

```
plot.criterion.lrgpr Plot AIC/BIC/GCV values for lrgpr() model as rank changes
```

### **Description**

Plots the criteria metrics returned by criterion.lrgpr

### Usage

```
## S3 method for class criterion.lrgpr
plot(x, col = rainbow(3), ...)
```

### **Arguments**

```
x list returned by criterion.lrgpr
col array of 3 colors
... other arguments
```

#### See Also

```
criterion.lrgpr
```

plot.cv.lrgpr

Plot Results of Cross-validation

#### **Description**

Plot results of cv.lrgpr, which fits cross-validation for multiple ranks of the LRGPR

### Usage

```
## S3 method for class cv.lrgpr
plot(x, ylim = c(min(x$cve - x$cvse), max(x$cve + x$cvse)),
    xlim = range(x$rank), pch = 20, col = "red",
    main = "Cross validation", xlab = "# of markers used",
    ylab = "Cross validation error", ...)
```

plot.lrgpr 19

#### Arguments

X	result of cv.lrgpr
ylim	limits of y-axis
xlim	limits of x-axis
pch	pch
col	col
main	main
xlab	xlab
ylab	ylab
	other parameters fed to plot()

plot.lrgpr

Plot Diagnostics for an 1rgpr Object

#### **Description**

Six plots (selectable by "which") are currently available: a plot of residuals against fitted values, a Scale-Location plot of sqrt(| residuals |) against fitted values, a Normal Q-Q plot, a plot of Cook's distances versus row labels, a plot of residuals against leverages, and a plot of Cook's distances against leverage/(1-leverage). By default, the first three and "5" are provided.

### Usage

```
## S3 method for class lrgpr
plot(x, which = c(1L:3L, 5L),
    caption = list("Residuals vs Fitted", "Normal Q-Q", "Scale-Location",
    "Cooks distance", "Residuals vs Leverage",
    expression("Cooks dist vs Leverage " * h[ii]/(1 - h[ii]))), panel = if
    (add.smooth) panel.smooth else points, sub.caption = NULL, main = "",
    ask = prod(par("mfcol")) < length(which) && dev.interactive(), ...,
    id.n = 3, labels.id = names(residuals(x)), cex.id = 0.75,
    qqline = TRUE, cook.levels = c(0.5, 1),
    add.smooth = getOption("add.smooth"), label.pos = c(4, 2),
    cex.caption = 1)</pre>
```

### **Arguments**

X	Irgpr object.
which	if a subset of the plots is required, specify a subset of the numbers "1:6".
caption	captions to appear above the plots; "character" vector or "list" of valid graphics annotations, see "as.graphicsAnnot". Can be set to "" or "NA" to suppress all captions.
panel	panel function. The useful alternative to "points", "panel.smooth" can be chosen by "add.smooth = TRUE".

20 predict.lrgpr

sub.caption	common title-above the figures if there are more than one; used as "sub" (s."title") otherwise. If "NULL", as by default, a possible abbreviated version of "deparse( $x$ call)" is used.
main	title to each plot-in addition to "caption".
ask	logical; if "TRUE", the user is _ask_ed before each plot, see "par(ask=.)".
• • •	other parameters to be passed through to plotting functions.
id.n	number of points to be labelled in each plot, starting with the most extreme.
labels.id	vector of labels, from which the labels for extreme points will be chosen. "NULL" uses observation numbers.
cex.id	magnification of point labels.
qqline	logical indicating if a "qqline()" should be added to the normal Q-Q plot.
cook.levels	levels of Cook's distance at which to draw contours.
add.smooth	logical indicating if a smoother should be added to most plots; see also "panel" above.
label.pos	positioning of labels, for the left half and right half of the graph respectively, for plots 1-3.

#### See Also

plot.lm

cex.caption

### Description

Predict response values after training with lrgpr. Leaving X\_test and K\_test as NULL returns the fitted values on the training set

### Usage

```
predict.lrgpr(object, X_test = NULL, K_test = NULL, ...)
```

controls the size of "caption".

### Arguments

object	model fit from lrgpr on training samples
X_test	design matrix of covariates for test samples
K_test	covariance matrix between samples in the test set and training set

... other arguments

print.lrgpr 21

print.lrgpr

Print Values

### Description

Print details for fit from lrgpr

### Usage

```
print.lrgpr(x, ...)
```

### Arguments

x model fit from lrgpr

... other arguments

print.summary.lrgpr

Object Summaries

### Description

Print summary for fit from lrgpr

### Usage

```
print.summary.lrgpr(x, ...)
```

### Arguments

```
x model fit from lrgpr
```

... other arguments

QQ\_plot

### Description

QQ plot and lambda\_GC optimized for large datasets.

### Usage

```
QQ_plot(p_values, col = rainbow(min(length(p_values), ncol(p_values))),
main = "", pch = 20, errors = TRUE, lambda = TRUE, p_thresh = 1e-06,
showNames = FALSE, ylim = NULL, xlim = NULL, plot = TRUE,
new = TRUE, box.lty = par("lty"), collapse = FALSE, ...)
```

### Arguments

p_values	vector, matrix or list of p-values
col	colors corresponding to the number of columns in matrix, or entries in the list
main	title
pch	pch
errors	show 95% confidence interval
lambda	calculate and show genomic control lambda. Lambda_GC is calculated using the 'median' method on p-values $>$ p_thresh.
p_thresh	Lambda_GC is calcualted using the 'median' method on p-values > p_thresh.
showNames	show column names or list keys in the legend
ylim	ylim
xlim	xlim
plot	make a plot. If FALSE, returns lamda_GC values without making plot
new	make a new plot. If FALSE, overlays QQ over current plot
box.lty	box line type
collapse	combine entries in matrix or list into a single vector
•••	other arguments

### **Examples**

```
p = runif(1e6)
QQ_plot(p)

# get lambda_GC values without making plot
lambda = QQ_plot(p, plot=FALSE)
```

read.fam 23

read.fam

Read plink FAM/TFAM files

### **Description**

Read FAM/TFAM file into a dataframe. This function is the same as read.tfam

### Usage

```
read.fam(file)
```

### **Arguments**

file

location of FAM/TFAM file

read.tfam

Read plink FAM/TFAM files

### Description

Read FAM/TFAM file into a dataframe. This function is the same as read.fam

#### Usage

```
read.tfam(file)
```

### Arguments

file

location of FAM/TFAM file

residuals.lrgpr

Extract Model Residuals

### Description

Residuals fitted with 1rgpr

### Usage

```
residuals.lrgpr(object, type = "working", ...)
```

### Arguments

object model fit with lrgpr

type the type of residual, but there is only one option here

... other arguments

24 summary.lrgpr

rstandard.lrgpr

Regression Deletion Diagnostics

#### **Description**

Basic quantities for regression deletion diagnostics from fit of lrgpr

### Usage

```
## S3 method for class lrgpr
rstandard(model, ...)
```

### **Arguments**

```
model model fit with lrgpr
... other arguments
```

set\_missing\_to\_mean

Replace Missing Values with Mean

### **Description**

For each column, replace NA values with the column mean

### Usage

```
set_missing_to_mean(A)
```

### **Arguments**

Α

matrix

summary.lrgpr

Summarizing LRGPR / Linear Mixed Model Fits

### **Description**

Print summary for fit from lrgpr

### Usage

```
summary.lrgpr(object, ...)
```

### Arguments

```
object model fit from lrgpr
... other arguments
```

vcov.lrgpr 25

vcov.lrgpr

Calculate Variance-Covariance Matrix for a 1rgpr Object

### **Description**

Returns the variance-covariance matrix of the main parameters of a fitted model object

### Usage

```
vcov.lrgpr(object, ...)
```

### Arguments

object model fit with lrgpr
... other arguments

wald

Composite hypothesis test of multiple coefficients

### Description

Performs a multi-dimensional Wald test against H0: beta\_i...beta\_j = 0 using the estimated coefficients and their variance-covariance matrix

### Usage

```
wald(fit, terms)
```

### **Arguments**

fit result of fitting with lrgpr

terms indices of the coefficients to be tested

### **Details**

The Wald statistic is

$$\beta_h^T \Sigma_h^{-1} \beta_h \sim \chi_{|h|}^2$$

where

h

specifies the coefficients being tested and

|h|

is the number of entries
